Data Transformation: Price List SAP Business ByDesign to SAP S/4HANA Cloud Public Edition Guide

For SAP Cloud Integration

Version 1.0 | October 2026

Data Transformation: Price List SAP Business ByDesign to SAP S/4HANA Cloud Public Edition

1. **Introduction**
   - **1.1. Definition**
   - **1.2. Intended Audience**
   - **1.3. Structure**
   - **1.4. System Connectivity**
   - **1.5. Additional Documentation**

2. **Business Scenario**

3. **Prerequisites**

   - **3.1. Overview**
   - **3.2. Supported Price List Types and Header Parameters**
   - **3.3. Pre-Migration Configuration Checklist**

4. **Consumption of integration flow**
   - **4.1. Data Extraction**
   - **4.2. Data Preparation**
   - **4.3. Data Transformation**
   - **4.4. Data Upload**

5. **Customization and Enhancement of integration flow**

6. **Contact Information**

1. Introduction

In this guide you shall learn how to consume the integration flow to transform data of object in SAP Business ByDesign into a form suitable and acceptable by SAP S/4HANA Cloud Public Edition

1.1. Definition

This integration flow is an accelerator that transforms the standard data of 'Price Lists object in SAP Business ByDesign into the SAP S/4HANA Cloud Public Edition's migration template of object 'Condition record for pricing (general template)'.

1.2. Intended Audience

This integration flow is intended to be used by both partners and customers who are in the data migration phase of their implementation project of moving their SAP Business ByDesign system to SAP S/4HANA Cloud Public Edition.

1.3. Structure

The structure of this guide follows the sequence of steps required to consume the integration flow for the purpose of data transformation using SAP Integration Suite service on SAP BTP.

1.4. System Connectivity

To use this integration flow you don't have to connect your SAP Business ByDesign system or SAP S/4HANA Cloud Public Edition system to SAP Integration Suite. The data extracted from SAP Business ByDesign is passed to SAP Integration Suite over HTTPS and the data prepared as output is a file that can be taken manually and uploaded in via Migration Cockpit.

1.5. Additional Documentation

SAP Integration Suite

Technical Data Migration SAP Business ByDesign to SAP S/4HANA Cloud

https://learning.sap.com/search?query=SAP+Business+ByDesign&page=1&access=free&objType=video&lsc_product=SAP+Business+ByDesign

2. Business Scenario

Customers who are looking to migrate from SAP Business ByDesign ERP system to SAP S/4HANA Cloud Public Edition system need an easy data migration path to save time and effort on data migration activities which is quite intensive.

With this intention SAP has delivered the mapping of data fields from SAP Business ByDesign Price List object to SAP S/4HANA Cloud Public Edition equivalent object as part of this integration flow. The end result of the integration flow will provide you Price List data file that is in the form of SAP S/4HANA Cloud Public Edition's material Price List migration template. You shall upload this file via Migration Cockpit in SAP S/4HANA Cloud Public Edition. This helps you to save effort and prepare the file easily for upload.

3. Prerequisites

To consume the integration flow you should have the following things done

a) Set up account in SAP BTP and subscribe to SAP Integration Suite service.
b) Set up required user roles and authorization in SAP BTP subaccount
c) Set up the required capabilities in SAP Integration Suite to trigger integration flow.
d) Have authorisation to the Data Extraction functionality in SAP Business ByDesign
e) Have authorisation to the Migration Cockpit app in SAP S/4HANA Cloud Public Edition
f) User should have the date format **DD.MM.YYYY** in SAP Business ByDesign system. if the date format is different user shall change it to the said format by navigating to User->My Settings->Date.

For setting up the required systems and users you can refer to these tutorials:
https://learning.sap.com/videos/preparing-for-data-migration-from-sap-business-bydesign-to-sap-s-4hana-cloud

3.1. Overview

- Price lists are migrated to SAP S/4HANA **as Condition records**, which are controlled by C**ondition types**.
- Each condition type defines how prices are stored, accessed, and applied during sales transactions.

- Before executing the migration, **custom or standard condition types**, along with their **condition tables** and **access sequences**, must already exist in SAP S/4HANA. These define how the pricing data is organized for each business scenario.
- During iFlow execution, the user must pass the **relevant condition type** for each price list in the **iFlow header parameters**, along with the SAP ByDesign extraction file.

3.2. Supported Price List Types and Header Parameters

er Parameter	Price List Type	Example Condition Type (S/4HANA)
base	Base Price List	Custom (e.g., ZPR1)
dstcn	Distribution Chain Price List	Standard PPR0 or custom (e.g., ZPR2)
cusp	Customer-Specific Price List	Custom (e.g., ZPR3)
cusgrp	Customer Group–Specific Price List	Custom (e.g., ZPR4)
comp	Company-Specific Price List	Custom (e.g., ZPR5)

- The iFlow currently supports 5 types of Price Lists mentioned in the table **Head**below

- Each price list type corresponds to a specific header parameter and S/4HANA condition type.

Example:
For a *Distribution Chain Price List*, you can use the **standard condition type** PPR0, or create a custom one (e.g., ZPR2) in S/4HANA.
When executing the iFlow, pass the chosen condition type (ZPR2) in the header parameter dstcn.

3.3. Pre-Migration Configuration Checklist

- Before running the iFlow, ensure the following objects are configured in SAP S/4HANA Cloud Public Edition

Object	Purpose
Condition Table	Defines key fields (e.g., Sales Org, Customer, Material).
Access Sequence	Controls lookup sequence of condition tables.

Object	Purpose
Condition Type	Defines the pricing element (e.g., Base Price, Discount).
Pricing Procedure	Combines condition types for use in pricing.
Condition Record Maintenance	Verify manually via pricing transaction.
User Roles & Transport	Ensure configuration is transported and accessible.

Example:
Create a condition type **ZPR2** for Distribution Chain Prices with access sequence linked to **VKORG**, **VTWEG**, and **MATNR**.
Pass ZPR2 as the **dstcn** header value when executing the iFlow.

4. Consumption of integration flow

Follow the steps below to transform your data and upload to SAP S/4HANA Cloud Public Edition.

4.1. **Prepare for Data Transformation**

To consume the integration flow for transformation, you need to prepare the data that you want to transform. You should extract the required Price List data from SAP Business ByDesign.

Follow the steps below for preparation. You can refer to the learning session to understand in details:

a. Extract the data from ByD in form of ZIP file:
   i. Login to Business by Design system (where the data is residing) and on the left menu navigate to Application and User Management work centre.
   ii. Choose and open Data Extraction work center view.
   iii. Create a new data extraction run for the Extraction Object FLEX_PRICE_LIST and define the filter parameters as you need. (Note: Use the Selection criteria parameters to avoid Inconsistent extraction results :

      - Price List ID
      - Status (Enter 3 for Released Status) (Other Statuses: 1- Not Released, 2-Partially Released, 5-Release Canceled)
      - Validity Start Date (should be maintained in YYYYMMDD format)
      - Validity End Date (should be maintained in YYYYMMDD format

   iv. Click Activate and Run. This will start the extraction job in the background.
   v. Check the status of the job in the Data Extraction view until it is finished.
   vi. Download the extracted ZIP file.

b. Create a migration project in S/4 HANA public cloud and make sure you have added the migration object *Condition record for pricing (general template)* to the project.

4.2. Data Preparation

Check the extracted file and ensure there are no blanks in any of the columns in the extracted file, ensure to fill the values in place of blanks. This file needs to be Zipped again and then passed to the integration flow via Post HTTP request.

4.3. Data Transformation

Once the data is prepared and ready in the required form, you are ready to execute the integration flow.

Make the following preparations to load the integration flow for executing data transformation.

a. Login to SAP Cloud Integration and search for the package “SAP Business ByDesign Master Data to SAP S/4HANA Cloud Public Edition” in Discover page and open it.
b. Open and copy the package into your workspace.
c. Select the package and click "Copy" to duplicate the entire package, including the "ByD Price List Data Transformation" integration flow, along with all other integration flows and documents.
d. Deploy the integration flow. Refer to the learning session for details.
e. After successful deployment of integration flow, make a note of the End
f. Point URL generated. Refer to the learning session for details.

To consume the integration flow for data transformation and create a S/4HANA migration file, follow the steps below. For details refer to the learning session.

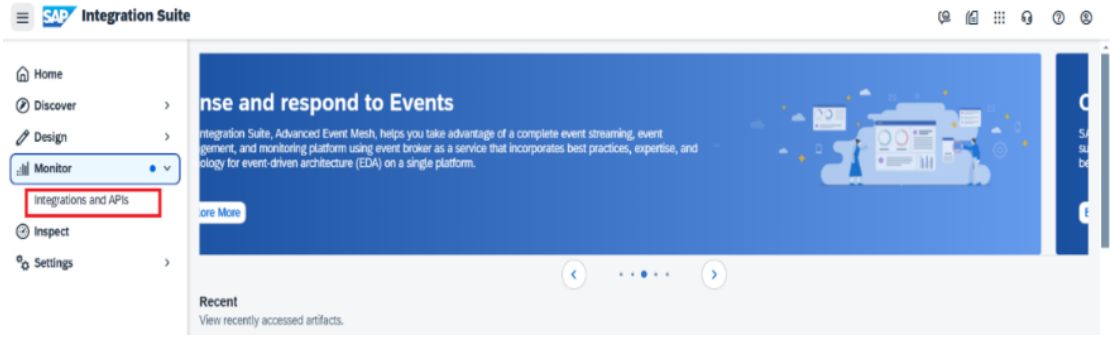

a. Set up an application to trigger the integration flow e.g., Postman.
b. Create a POST HTTP request, provide the user credentials, and upload the extracted ZIP file in the body of the request and pass the headers
c. Send the request to the end point URL of integration flow. This will trigger the integration flow and start the data transformation. As a result, you shall receive a response file back from your triggering application.

d. The following header parameters must be passed in the HTTP request to determine the price list type and guide the mapping logic:

Header Name	Description	Example Value
base	Condition type for **Base Price List**	ZPR1
dstcn	Condition type for **Distribution Chain Price List**	ZPR2
cusp	Condition type for **Customer-Specific Price List**	ZPR3
cusgrp	Condition type for **Customer Group–Specific Price List**	ZPR4
comp	Condition type for **Company-Specific Price List**	ZPR5

e. **Note:** Unprocessed Records log: During data transformation in the integration flow, certain records may not be processed and requires manual processing. Follow the steps below to find such unprocessed records log and act on them.

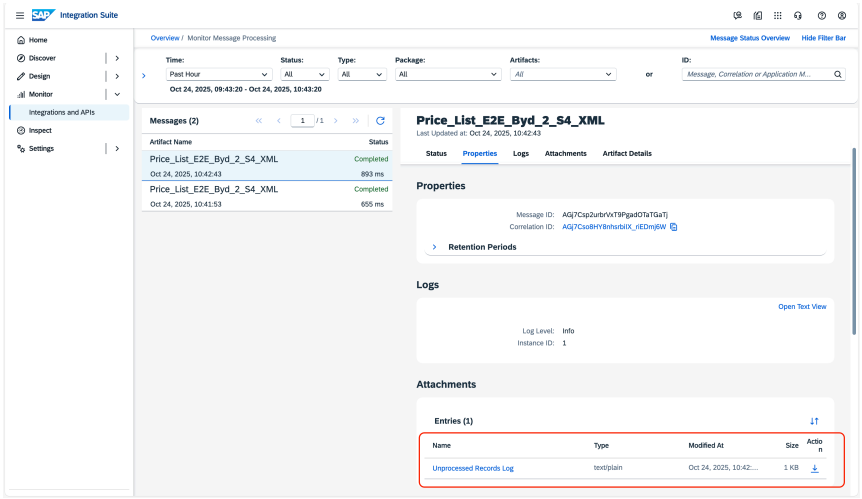

f. In SAP Integration Suite, navigate to the left-side menu and select **Monitor**. Then, click on **Integrations and APIs** under the Monitor.

g. Under Monitor Message Processing, Select **All Artifacts - Past Hour Messages** to view recent message processing data.

h. Locate the relevant message based on the integration flow name and trigger time, then click on it. On the right-hand panel, select **Attachments**.

i. In the **Attachments** section, you will find an entry named "**Unprocessed Records Log**".

j. Open the log file to identify records that were not processed. The log specifies unprocessed records.
k. For example if the log states TEST_123, it means the Price List with ID TEST_123 was not processed.

4.4. **Data Upload**

Once the data is transformed and you have received the S/4HANA template file filled with the data (response file) you are ready to upload the same to S/4HANA system via Migration Cockpit.

Follow the below steps to upload the data to S/4HANA system:

a. Save the response ZIP file received.
b. Extract the XML file in ZIP. Open the XML file in Excel and click on save. Close the file.
c. This is the file that should be taken to SAP S/4HANA Cloud Public Edition migration project and uploaded. For details on uploading a file via migration cockpit in SAP S/4HANA Cloud Public Edition refer to this help document.

5. Customization and Enhancement of integration flow

You can customize the mapping or enhance the integration flow as per your requirement. For details on customization, you can refer to these tutorials:

- Tutorial 1: Customizing standard integration flows for data migration from SAP Business ByDesign to SAP S/4HANA Cloud Public Edition.
- Tutorial 2: Updating data structure in integration flows for data migration from SAP Business ByDesign to SAP S/4HANA Cloud Public Edition.
